Data & AI Hackathon: 8-Hour Innovation Sprint at AWS Builder Loft, SF

Join us for the Data & AI Hackathon, an electrifying 8-hour sprint bringing together the brightest minds in data engineering, machine learning, and AI, all under one roof at the iconic AWS Builder Loft in San Francisco!

 Whether you're an AI researcher, data scientist, backend engineer, or prompt designer, this is your chance to build next-generation intelligent systems, explore real-time data pipelines, and connect with the most passionate builders in the Bay Area.

Event Details

- When: 09:30 AM – 6:00 PM, September 11, 2026
- Where: AWS Builder Loft, San Francisco, CA
- Theme: Data & AI Infrastructure, Agentic Workflows & Foundation Models

What to Expect:

- High-Energy Building Sessions: 8 hours to prototype cutting-edge Data & AI solutions.
- Data & AI Challenges: Solve real-world problems around intelligent automation, real-time analytics, vector search, and LLM orchestration.
- Expert Mentorship: On-site guidance from veteran AI researchers and infrastructure engineers.
- Swag, Catering & Networking: Fuel up with snacks and lunch while connecting with fellow builders and founders.
- Prizes & Demos: Win exciting prizes and pitch your build directly to AI investors and industry leaders.

Agenda:

- 09:30 AM – 10:00 AM: Check-in & Breakfast 
- 10:00 AM – 11:00 AM: Keynote, Theme Briefing & API Workshops
- 11:00 AM – 12:00 PM: Hacking Starts & Team Formation
- 12:00 PM – 01:00 PM: Lunch Break 
- 01:00 PM – 03:30 PM: Deep Hacking & Mentor Office Hours
- 03:30 PM: Project Submission Deadline
- 04:00 PM – 04:40 PM: Top 5 Live Demos & Presentations

- 04:40 PM – 05:00 PM: Awards & Closing Ceremony
- 05:00 PM – 06:00 PM: Networking & Happy Hour

About Our Partners

RocketRide

RocketRide is an open-source, developer-native AI meta-harness. Build, debug, and deploy production AI workflows right inside your IDE. And with **RocketRide Cloud**, teams can offload the complexity of AI infrastructure and focus on building solutions, with cost-efficient execution through our proprietary model server, shared pipelines for collaboration, higher performance, and seamless scalability.

- 🎁 Free credits: We're giving away free credits for RocketRide Cloud, 100% off your first purchase with a promo code. Join the **Discord** to grab yours.
- 📖 Step-by-step guide: Setup, demos, and how to build on RocketRide (Cloud + open-source): [click here](#)
- 🚀 Submit your project: Post it in the #showcase channel on **Discord**. Make sure to include your project's GitHub link and all your .pipe files (import them from RocketRide Cloud). Need help? Just ask our bot in #support, whether it's about your project or the tools.

Let's build something awesome together. 💻 ✨

RocketRide Rewards:

- 🚀 Best Use of RocketRide: Build your project on RocketRide Cloud and deploy an AI pipeline without managing any infrastructure. Our hackathon app will track which team uses RocketRide the most, and the winning team takes home Apple AirPods Pro 3 worth \$1,000! 🔥

New to RocketRide? Cloud is live: cloud.rocketride.ai 🚀

Hotdata

Hotdata is instant data infrastructure for AI agents. Let every agent spin up on-demand low latency databases to search, query, and analyze data concurrently.

Built in Rust on Apache DataFusion and DuckLake, Hotdata lets developers spin up isolated databases on demand without provisioning or managing database infrastructure.

- ⚡ Instant databases: Spin up a database for every agent, user, branch, or task.
- 🤖 Built for agents: Query structured data, run full-text and vector search, and perform analytics from one data layer.
- 🚀 Built for concurrency: Run thousands of agents against data in parallel while maintaining low query latency.
- 📖 Get started: Follow the [Hotdata docs](#) to start building.

At the hackathon, try giving every RocketRide agent its own Hotdata database and see what you can build when agents can work with data independently and in parallel.

Hotdata Rewards:

🚀 Best Use of Hotdata: Build an application where multiple agents or users need to search, query, or analyze data concurrently. We're especially excited to see projects that would be difficult to build with a single shared database.

🏆 Prize: The winning team takes home an Apple AirPods Max 🔥

Let's see what happens when databases become as easy to spin up as agents.

📺 Free credits: New to Hotdata? [Sign up here](#) and get 100% off for first-time users.

💬 Build with us: Join our [Discord](#) to share what you're building, get help, and connect with the Hotdata team.

Cognee.ai

Cognee is an open-source memory engine for AI agents. It helps developers turn unstructured data into structured, searchable knowledge that agents can remember, reason over, and retrieve when needed.

- 🧠 AI memory: Build persistent memory and context for your AI agents.

-  Knowledge graphs: Transform documents and data into connected knowledge that agents can reason over.
-  Built for developers: Easily integrate memory into your existing AI applications and agent workflows.
-  Get started: Explore the [Cognitive docs](#) and start building.

At the hackathon, try using Cognitive to give your agents long-term memory and contextual understanding—so they can go beyond simple retrieval and actually build knowledge over time.

Snyk

Snyk is a developer-first cybersecurity platform that helps teams build fast without compromising on security. As developers rely heavily on AI to write code at unprecedented speeds, Snyk continuously scans and secures application code, open-source dependencies, containers, and cloud environments right within the developer's workflow. For an AI hackathon, it matters because shipping code quickly with AI generators or autonomous agents also means shipping security risks at machine speed. Snyk acts as an intelligent security layer, catching vulnerabilities and automatically applying verified fixes in real time—allowing builders to ship ambitious AI projects safely and with complete confidence.

At this event you will learn:

- 1) [Sign-up for free \(no credit card required\)](#), how to import your code, and configure your AI coding tool
- 2) Free [AI Security Engineer Foundations Certificate](#)

Event Terms & Consent

By registering, you agree to the event [terms and conditions](#). RocketRide reserves the right to refuse admission or remove attendees at its discretion to keep things safe and enjoyable for everyone.

Photography and video recording will take place throughout the evening and may be used by RocketRide for future marketing, promotional, and community content. By registering, you also consent to receiving the RocketRide newsletter and updates about future events at the email address you provide. You can unsubscribe anytime via the link in any email.

Spots are limited. Register now and build the future of Enterprise AI.

🔥 Seats are limited! Register now and build the future of Data & AI with us!

Today, 9:33 AM

Check in starts soon!

Hi everyone,

We are incredibly excited to see you today! To ensure a smooth check-in and get you building as quickly as possible, please review the essential details below.

Location & Entry (Action Required)

- Venue: AWS Builder Loft ([Google Maps](#)) – *Please head directly to the 2nd floor.*
- CRITICAL STEP: To access the venue, you must complete this link:
<https://events.builder.aws.com/vBELdw>
- ID Required: You must bring a valid physical ID with you to enter the building.

Schedule

- Event Duration: 9:30 AM – 6:30 PM
- Doors Open / Check-in: 9:40 AM
- Arrival Deadline: Please arrive no later than 9:55 AM

Problem statements are live - Come prepared

Hi everyone,

The problem statements are officially live! 🎉

There are two tracks to choose from, each with a different way to approach the hackathon. Take a look at both and choose the challenge that excites you most.

Main Track

[View the Problem Statements](#)

Build a solution to a real-world problem with compound agents. These challenges span different industries, technologies, and use cases.

Multi-Agent Track

[View the Problem Statements](#)

Build with parallel agents and multi-agent systems. Explore what happens when multiple AI agents can work together, divide tasks, coordinate, share context, and solve problems that are difficult for a single agent.

Whether you want to tackle a real-world industry problem or experiment with the next generation of agentic systems, there's a track for you.

A few things to know

- You can participate in either track

- Overall hackathon winners will be selected each from the Main Track and Multi-Agent Track
- Each track has its own prizes and opportunities
- Both tracks give you the opportunity to build something, meet participating companies, and showcase your work

The important thing is to choose the problem you're most excited to build around.

Start going through the problem statements, form your teams, and come prepared to build! 🚀

Join the WhatsApp group for updates, announcements, and event communication:

Re: Problem Statement Out

Problem Statements Are Live

Hi everyone,

The problem statements are officially live! You can now review the challenges and choose the track you want to participate in.

Main Track:

https://docs.google.com/document/d/14FdPbLDZUuUei7JtLK-oQJeivwzej8ik-_PgCrs1EmY/edit?usp=sharing

Side Track:

https://docs.google.com/document/d/1UMDAo-Bm_4kKZZC1JHpHZW71heGVWfbrGe5lftQzEP8/edit?usp=sharing

You can participate in either the Main Track or Side Track, so make sure you go through the problem statements and come prepared.

That said, we strongly recommend the Main Track if you're looking to maximize your chances of winning:

- The overall/general winners will be selected from the Main Track
- More companies are participating in the Main Track
- More prizes and opportunities are available
- Main Track participants will also be eligible for Side Track prizes
- More opportunities to interact with participating companies and showcase your project

So if you're deciding between the two, the Main Track gives you the biggest opportunity to compete, win, and get noticed.

Start going through the problem statements, form your teams, and come prepared to build!

Join the WhatsApp group for updates, announcements, and event communication:

URGENT: Action Required to Secure Your Hackathon Spot! 🚨

Hi,

Congratulations on making it to the RSVP page! With 1,500+ applications submitted, competition is extremely tight, and we unfortunately cannot accept every team.

To claim your spot, you must complete the following two steps ASAP:

- ① Complete the RSVP Form & Register on AWS: [Open Google Form](#) (Note: You must complete the AWS portal registration link inside the form to RSVP. Completing this RSVP directly confirms your spot).
- ② Join the Official WhatsApp Community: [Join WhatsApp Group](#)

Problem Statement would be released at 2:00 PM.

Spots are limited and filled on a strict priority basis. Failure to register on the AWS portal via the form will result in your spot being passed to the next waitlisted applicant.

Best of luck! 🚀

Rote Playoffs Hackathon - Win a MacBook Pro + iPhone 17

? What a Play is

Think of the workflow you've done three times this week and resented every time. A Play is that workflow, solved once and kept properly.

You create it with rote by working through the job with your agent as normal. rote keeps the procedure that worked so it can be run again with fresh inputs. It's reusable, and it's

inspectable, meaning anyone can open it up and see exactly what it does before trusting it with their own work.

Apply now: <https://luma.com/rotehack?tk=8gMaZb>

Data and AI Hackathon: From Memory to Muscle Memory

Hackathon Problem Statement & Official Builder Guide

Event Details	Information
Format	8-Hour Build Sprint
Date	Sep 11, 2026
Venue	📍 AWS Builder Loft
Track Partners	RocketRide.ai · HydraDB · hotdata.dev · Cognee.ai · Modiqo.ai · Snyk

1. Theme

Most AI agents today are smart once and forgetful forever. They can reason brilliantly in a single session, but the moment that session ends, everything they learned what worked, what the user prefers, what the data actually looks like evaporates. The next task starts from zero, at full token cost, with full risk of repeating yesterday's mistakes.

Compound Agents is about building systems where every run makes the next run smarter, cheaper, and more reliable. That requires five things working together as one cohesive stack, not five disconnected API keys:

- **Structure:** Turning messy raw data into something an agent can actually reason over.

- **Memory:** A durable, queryable substrate where that structure lives and compounds over time.
- **Insight:** The ability to query, join, and analyze live and historical data on demand.
- **Motion:** Turning what the agent knows into real actions across real tools.
- **Muscle Memory:** Remembering how a task was done successfully, so it doesn't have to be rediscovered from scratch next time.

Teams at this hackathon will build a product, agent, or workflow that shows the full loop: an agent that learns something, stores it, queries it, acts on it, and gets more reliable every time it does.

2. Mandated Tech Stack

Every submitted project must integrate all five sponsor technologies in a meaningful, load-bearing way. Judges will specifically check that each tool is actually doing work in your architecture not just imported once and never called again.

The five tools are designed to stack: each one owns a distinct layer, and they are built to be combined rather than compete with each other. Below is what each tool is for and where it slots into your application.

Cognee.ai The Memory Construction Layer

Cognee is an open-source memory platform for AI agents. It ingests raw, messy data documents, tickets, conversations, code, Slack threads, PDFs and runs it through an ECL pipeline (Extract, Cognify, Load) that turns unstructured input into a structured knowledge graph with embeddings and relationships.

- Point Cognee at your raw data sources (files, APIs, conversation logs, whatever your idea produces) and let it extract entities and relationships automatically instead of hand-writing a schema.
- Use Cognee's **remember** / **recall** primitives to turn a single interaction into a durable memory unit rather than a one-off chat turn.
- Treat Cognee as the layer that decides what gets remembered and how it's structured the graph it builds is what downstream layers store and query.

HydraDB The Memory Storage & Serving Layer

HydraDB is an object-store-native graph database purpose-built as the context substrate for AI systems. It gives you snapshot-consistent OpenCypher queries and fast multi-hop graph traversal over the structured memory your agent accumulates.

- Use HydraDB as the durable home for the graph Cognition constructs this is where memory actually lives across sessions, users, and time, not just within a single run.
- Query it with Cypher for relationship-aware retrieval (multi-hop) instead of flat similarity search *"what changed since last session," "who owns this," "what's blocking this"* are HydraDB questions, not vector-search questions.
- Write to it continuously as your agent operates so memory compounds instead of resetting between runs.

Cognition vs. HydraDB, in one line: Cognition decides what's worth remembering and shapes it into a graph; HydraDB is where that graph is durably stored and served at low latency. Most winning projects will use them together Cognition as the front door for ingestion, HydraDB as the backing store.

hotdata.dev The Live Query & Analytics Layer

hotdata.dev is an ultra-high-concurrency execution layer that gives every agent an isolated, ephemeral environment to run SQL, vector, full-text, and geospatial queries against your existing data without waiting on shared compute.

- Give your agent fast, isolated, ad-hoc query power over structured or semi-structured data (a product catalog, a transaction log, a location dataset, a live leaderboard) that doesn't need to go through the memory graph.
- Use it for the *"what's happening in the data right now"* questions search, aggregate, join, filter that complement HydraDB's relationship-aware recall with raw analytical horsepower.
- Load a file directly (e.g. Parquet/CSV) into an instant database for fast scratch work, or query existing sources in place.

RocketRide.ai The Motion / Orchestration Layer

RocketRide is the AI orchestration and agent-execution layer it's how your system turns "what the agent knows" into "what the agent does": tool calls, multi-step task execution, real API actions.

- Wire RocketRide as the execution engine that reads from HydraDB memory and hotdata.dev query results, decides the next action, and executes it.
- Use it to orchestrate calls to external tools/APIs the actual "motion": sending a message, booking something, updating a record, triggering a workflow.
- If your project has multiple steps or chained tool calls, this is the layer that sequences and executes them.

Modiqo.ai (Rote) The Muscle-Memory / Reliability Layer

Modiqo's Rote is a local execution layer that watches what your agent does when a task succeeds, and turns that successful run into deterministic, reusable code no server infrastructure, sidecars, or SDKs required to connect it to your APIs.

- Sit Rote underneath your RocketRide execution loop: the first time a task succeeds, Rote captures the working path (API calls, sequence, parameters).
- On repeat runs of the same task, replay the captured deterministic workflow instead of re-reasoning from scratch cutting token usage and reserving inference for genuinely novel parts of the task.
- Use it to make your project's second, third, and tenth run visibly faster, cheaper, or more reliable than the first this is the *"proof of compounding"* judges will look for.

Please complete your setup today before arriving by visiting the [Rote Playoffs guide](#).

Make sure to complete the following requirements:

1. Signup + install.
2. Run 'hello world' warm-up play.

Sign into the Discord channel and say 'ready & warmed up'.

Snyk

Snyk is a developer-first cybersecurity platform that helps teams build fast without compromising on security.

[Sign-up to Snyk for free](#), connect Snyk to your favorite AI coding tool (Claude, Codex, Cursor, etc) and use it to ensure your app doesn't have any security vulnerabilities (Apps will be scanned with Snyk and security vulnerabilities found will reduce points from the final score)

Note on Judging: Every layer must do real, repeated work over the course of the 8 hours not a one-line SDK import that's never called again. The strongest projects will visibly get better at their task as the hackathon progresses, because memory (Cognee/HydraDB),

insight (hotdata.dev), muscle memory (Modiqo), and security (Snyk) are all compounding underneath the agent's actions (RocketRide).

3. Reference Architecture

This is the suggested shape most winning projects will follow. The five tools are stackable each layer is independently useful, but combining them is what creates winning entries.

Data Flow in One Line:

Cognee turns raw data into structured memory → HydraDB stores and serves that memory durably → hotdata.dev adds fast ad-hoc query power over live/structured data → RocketRide decides and acts on both → Modiqo captures what worked so the next run doesn't have to rediscover it → **The loop compounds.**

Teams are encouraged to remix the stack (e.g., hotdata.dev feeding HydraDB, or Modiqo capturing a hotdata.dev query pattern instead of a RocketRide action) as long as all five are load-bearing.

4. Suggested Project Ideas

Pick one, remix one, or bring your own. Every idea below utilizes all five mandated technologies.

Project Idea	Cognee (Memory)	HydraDB (Storage)	hotdata.dev (Live Query)	RocketRide.ai (Motion)	Modiqo.ai (Muscle Memory)
Compounding Support Desk	Structures every ticket, reply, and resolution into entities and relationships	Stores customer + ticket + resolution graph across sessions	Queries live ticket volume, SLA breaches, and product-area trends	Executes replies, escalations, and record updates	Captures resolution playbooks as reusable, deterministic fixes for repeat issues
Self-Improving Research Assistant	Extracts claims, sources, and contradictions from new papers/articles	Persists the evolving research graph across sessions	Runs ad-hoc queries over a live feed of new papers/signals	Fetches, reads, summarizes, and files findings autonomously	Turns a successful research workflow (search → filter → summarize) into a reusable pipeline
Recruiting Copilot That Gets Faster	Builds candidate–skill–role relationship	Stores pipeline history and	Searches/filters live candidate	Sends outreach,	Captures the outreach sequence that

Project Idea	Cognee (Memory)	HydraDB (Storage)	hotdata.dev (Live Query)	RocketRide.ai (Motion)	Modiqo.ai (Muscle Memory)
	graph from resumes/applications	past outreach outcomes	activity and role requirements	schedules interviews	got a reply and replays it for similar candidates
Fraud/Anomaly Graph Agent	Extracts entities (accounts, devices, merchants) from transaction narratives	Models the entity-relationship graph for multi-hop fraud detection	Runs fast SQL/geo queries over live transaction streams	Triggers holds, alerts, or human-review hand-offs	Captures investigation steps that confirmed fraud as a reusable triage workflow
Personal Finance Memory Agent	Structures spend history and goals into a personal graph	Remembers spending patterns and goals over time	Queries live price, market, and spend data on demand	Nudges or executes budgeting actions	Turns a successful budgeting intervention into a repeatable, deterministic nudge routine
Legal/Contract Research Agent	Extracts clauses, precedents, and obligations from filings	Stores the clause / precedent / obligation graph long-term	Searches live incoming filings/contracts for relevant matches	Automates document assembly and redlines	Captures a successful redline pattern as a reusable clause-fix workflow
Event Networking Matchmaker	Builds attendee interest / connection graph from check-ins and profiles	Persists the connection graph across the event	Queries live check-in, location, and interest-tap data	Sends real-time "you should meet X" nudges	Captures which nudge sequences led to real meetups and reuses them

Project Idea	Cognee (Memory)	HydraDB (Storage)	hotdata.dev (Live Query)	RocketRide.ai (Motion)	Modiqo.ai (Muscle Memory)
AI Coding Agent with a Real Memory	Structures codebase history, decisions, and past errors	Stores codebase and decision graph across sessions	Queries live CI results, test coverage, or repo activity	Executes fixes, PRs, or refactors	Captures a successful debugging path and replays it when the same error appears
Smart Home / IoT Orchestrator	Extracts household routines and preferences from usage logs	Remembers routines and preferences as a long-term graph	Queries live sensor events (motion, temp, door/window)	Executes actual automations (lights, locks, thermostat)	Captures automation sequence that resolved a conflict and reuses it next time
Sales Deal Memory Agent	Structures call notes, emails, and CRM activity into a deal graph	Stores deal history and stakeholder relationships over time	Queries live pipeline/account data for risk signals	Drafts follow-ups and updates CRM records	Captures the follow-up sequence that moved a deal forward and reuses it on similar deals

5. Setup Checklist

Complete this checklist before the event starts 8 hours fast, don't burn the first hour on account creation!

- ☐ **RocketRide.ai:** Create an account on staging.rocketride.ai and add credits using the coupon code given at the hackathon & generate an API key.
Full Set up guide: [Guide](#)
Full Step by step tutorial: [Youtube Tutorial](#)

- ☐ **HydraDB:** Create an instance (cloud or local via the open-source repo) and confirm your connection string.
- ☐ **hotdata.dev:** Install the CLI (`brew install hotdata-dev/tap/cli`), register, and connect at least one data source.
- ☐ **Cognee.ai:** Install the SDK (self-hosted, Docker, or Cognee Cloud) and confirm you can run a basic ingest.
- ☐ **Modiqo.ai (Rote):** Get access to Rote and confirm it can connect to at least one of your target APIs.
- ☐ **Snyk.io:** Create a [free account](#), and ensure your project is free of security vulnerabilities

6. Pre-Hackathon Warm-up

Please complete your setup today before arriving by visiting the [Rote Playoffs guide](#).

Make sure to complete the following requirements:

3. Signup + install.
4. Run 'hello world' warm-up play.

Sign into the Discord channel and say 'ready & warmed up'.
